We use a 2D co-ordinate plane to develop understanding regarding multiplication and also a *lot* of algebra.

It was developed by Rene Descarte, in 1637, when he lay in his sick bed - watching ants crawl across a tiled ceiling!

The Ancient Greeks did not have the notion of a co-ordinate plane but they used similar geometric methods to develop very sophisticated algebra over 2500 years ago!

Expand and Simplify

- Find the sum of these four expressions and simplify it

1. $(x + 3)^2$

5. $(x + 5)^2 + 3$

8. $x(x - 8) - (x - 8)$

<u>$x^2 + 6x - 16$</u>	1 $x^2 + 6x + 9$	6 $x^2 + 6x + 8$	<u>$x^2 + 9$</u>
2 $x^2 + 7x + 12$	8 $x^2 - 9x + 8$	<u>$x^2 - 5x + 12$</u>	3 $x^2 - 8x + 14$
7 $9 - x^2$	<u>$-x^2 + 6x + 36$</u>	5 $x^2 + 10x + 28$	4 $x^2 + x - 12$

The four expressions left simplify to $2x^2 + 7x + 41$

- These are multiplication grids
- We can use these to expand quadratics such as $(x + 3)(x + 4)$

$$(x + 4) \times \begin{array}{|c|c|c|} \hline & x & +3 \\ \hline x & x^2 & 3x \\ \hline +4 & 4x & 12 \\ \hline \end{array}$$

$$x^2 + 3x + 4x + 12$$

Now we can simplify by collecting like terms to get this

$$\longrightarrow x^2 + 7x + 12$$

There are 4 terms after expanding the brackets. That's why these expressions are called quadratics – as 'quad' means four.

$$\begin{array}{c}

Write some digits in a circle

e.g.
$$\begin{array}{c} 3 & 5 & 4 \\ 8 & 6 & \end{array}$$

- The sum of the squares of the two-digit numbers read clockwise is

$$54^2 + 46^2 + 68^2 + 83^2 + 35^2 = 17770$$

- The sum of the squares of the two-digit numbers read anticlockwise is

$$53^2 + 38^2 + 86^2 + 64^2 + 45^2 = 17770$$

Prove that the two sums will always be equal for any circle of digits
